

Exact Algorithms for Constraint Satisfaction Problems

The Boolean satisfiability problem (SAT) and its generalization to variables of higher arities - constraint satisfaction problems (CSP) - can arguably be called the most natural of all NP-complete problems. The present work is concerned with their algorithmic treatment. It consists of two parts. The first part investigates CSPs for which satisfiability follows from the famous Lovasz Local Lemma. Since its discovery in 1975 by Paul Erdos and Laszlo Lovasz, it has been known that CSPs without dense spots of interdependent constraints always admit a satisfying assignment. However, an iterative procedure to discover such an assignment was not available. We refine earlier attempts at making the Local Lemma algorithmic and present a polynomial time algorithm which is able to make almost all known applications constructive. In the second part, we leave behind the class of polynomial time tractable problems and instead investigate the randomized exponential time algorithm devised and analyzed by Uwe Schoning in 1999, which solves arbitrary clause satisfaction problems. Besides some new interesting perspectives on the algorithm, the main contribution of this part consists of a refinement of earlier approaches at derandomizing Schonings algorithm. We present a deterministic variant which losslessly reaches the performance of the randomized original.

New exact algorithms for the 2-constraint satisfaction problem binning this algorithm with a rounding scheme of Raghaven- dra and Steurer In a constraint satisfaction problem (CSP) instance, we are given a finite alphabet
 [cs/0604079] **Polynomial Constraint Satisfaction, Graph Bisection** Exact Algorithms for Constraint Satisfaction Problems [Robin Moser] on . *FREE* shipping on qualifying offers. The Boolean satisfiability problem **Exact Algorithms for Hard Graph Problems - SUPSI - Dalle Molle** Constraint Satisfaction Problems (CSPs), and describe two new ways .. exact algorithms for solving them, since such algorithms by necessity must run in **Exact Algorithms for Constraint Satisfaction Problems: Robin Moser** Abstract: In the Permutation Constraint Satisfaction Problem (Permutation CSP) we are given a set of variables and a set of constraints C, **A Probabilistic Algorithm for k-SAT and Constraint Satisfaction Polynomial constraint satisfaction problems, graph bisection, and** Many optimization problems can be phrased in terms of constraint satisfaction. In particular MAX-2-SAT and MAX-2-CSP are known to

Exact Algorithms for Constraint Satisfaction Problems Keywords: exact exponential time algorithms, constraint satisfaction, is a special case of the maximum 2-constraint satisfaction problem (MAX-2-CSP).
